QUESTION

- 1) You are asked to develop a program to play lottery. Your program randomly generates a lottery of a two-digit number, prompts the user to enter a two-digit number, and determines whether the user wins according to the following rule:
- If the user input matches the lottery in exact order, the award is \$10.000.
 - If all the digits in the user input match all the digits in the lottery, the award is \$3.000.
 - If one digit in the user input matches a digit in the lottery, the award is \$1,000.

Help: That is how you can generate a two digit random number.

```
int example = (int)(Math.random()*100)
```

```
run:
Enter your guess
25
The lottery number is 24
Match one digit. The reward is $1.000
BUILD SUCCESSFUL (total time: 2 seconds)
```

```
run:
Enter your guess
38
The lottery number is 56
No match! You lost
BUILD SUCCESSFUL (total time: 1 second)
```

- 2) Write a program that plays scissor-rock-paper game. A scissor can cut a paper, a rock can knock a scissor, and a paper can wrap a rock. The program randomly generates a number of 0,1 or 2 representing scissor, rock, and paper. The program prompts the user to enter a number 0,1 or 2 and displays a message indicating whether the user or the computer wins, loses or draws.

Help: That is how you can generate a random number between 0 and 2

```
import java.util.Random;
```

```
Random rnd = new Random()
```

```
int cmp = rnd.nextInt(3)
```

```
run:
```

```
Scissor (0) Rock (1) Paper (2): 2
```

```
It's a draw!
```

```
BUILD SUCCESSFUL (total time: 2 seconds)
```

```
run:
```

```
Scissor (0) Rock (1) Paper (2): 1
```

```
Computer wins!
```

```
BUILD SUCCESSFUL (total time: 1 second)
```
